Differential Equations Boundary Value Problems

In this section we'll define boundary conditions (as opposed to initial conditions which we should already be familiar with at this point) and the boundary value problem. We will also work a few examples illustrating some of the interesting differences in using boundary values instead of initial conditions in solving differential equations.

boundary conditions is called a boundary-value problem (BVP). Boundary conditions come in many forms. For example, $y(6) = y(22)$; $y_0(7) = 3y(0)$; $y(9) = 5$ are all examples of boundary conditions. Boundary-value problems, like the one in the example, where the boundary condition consists of specifying the value of the solution at some point are also called initial-value problems (IVP). Example 1
